

You Collab - Implementation Status Report

Product Changes & Implementation Requirements | Prepared 28 July 2026 | Assessed against the working codebase, not against plan documents.

Executive Summary

Of 38 requirements in the Product Changes document, **25 are complete and verified**, 6 are partially delivered, 3 contain defects, and 4 are not started. **Overall completion: 74%.**

The gig lifecycle, pricing/plan model and application-slot system were delivered this cycle and are covered by an automated suite of 39 checks that runs against a real database (including a concurrency test). The stability and UX items requested as Priority 1 are done.

Three items need a decision or a small fix before this is production-ready. They are listed under Risks below and total roughly one day of work.

Status	Count	Notes
Complete and verified	25	Gig lifecycle, plans, slots, P1 stability/UX
Partially delivered	6	Usable, with a named gap
Contains defects	3	See Risks - all have a known fix
Not started	4	Phone auth (reverted by request) + Google Maps

Risks Requiring a Decision

1. Campaign limits can be bypassed	A brand can exceed their paid plan by editing a campaign's status directly, and four simultaneous requests can create four campaigns on a two-campaign plan. Both were reproduced against the database. This is the paywall, so the commercial impact is direct.	Fix: ~15 lines. Est. 2 hours.
2. Instagram breaks on a fresh deployment	The Instagram database columns live in a migration file the migration script does not run. Everything works today only because that file was applied by hand at some point. A clean environment would ship with Instagram non-functional.	Fix: merge one file. Est. 30 minutes.
3. Brand-facing screens not verified in a browser	All new brand UI sits behind a login that requires a real account. Backend logic is covered by automated tests against a live database; the rendering of those screens is not yet confirmed.	Needs: 20 minutes with a test account.

Feature Detail

Authentication

Phone number + OTP login	MISSING	Built, then reverted to email at stakeholder request
Remove Google sign-in	MISSING	Still enabled
Remove email OTP	MISSING	Still the active method
Existing-user migration safety	PARTIAL	Safe today; untested against phone identities
Role onboarding and dashboard routing	DONE	Unchanged and working

Application Management and UX

Accept confirmation dialog	DONE	Wording matches the document exactly
Reject confirmation dialog	DONE	Applied on both brand screens
Blank-screen fix	PARTIAL	Root cause removed app-wide; original report never reproduced
Logout confirmation	DONE	All sign-out entry points
Loading / error / empty / success states	DONE	Present across new screens

Profile

Profile picture cropping	DONE	Square crop, zoom, works on mobile
--------------------------	------	------------------------------------

Gig Lifecycle

Published and expiry timestamps	DONE	Applied to the live database
14-day expiry, configurable	DONE	Set in backend config, not hardcoded
Draft / Active / Expired / Closed	DONE	Existing campaigns migrated without data loss
Automatic expiration	DONE	Background sweep every 15 minutes
Expired campaigns reject applications	DONE	Enforced server-side, verified
Expired hidden from discovery	DONE	Still visible to the brand for history

Pricing and Plans

Free plan (2 campaigns / 12 slots)	DONE	Values stored in the database
Starter plan (INR 99, 5 / 36)	DONE	Editable without a code change
Growth plan (10 / 64)	DONE	Price configurable
Campaign limit enforcement	DEFECT	Bypassable - see Risk 1
Plan upgrade screen	PARTIAL	Backend ready; no customer-facing screen

Application Slots

Slot allocation per campaign	DONE	Brand can reallocate from the dashboard
Shared pool across campaigns	DONE	Totals validated against the plan
Minimum one slot per campaign	DONE	Enforced at three levels
Remaining slots displayed	DONE	Counter and progress bar per campaign
Duplicate applications prevented	DONE	Database-level guarantee
Full campaigns reject applications	DONE	Holds under simultaneous requests

Location and Instagram

Creator location capture	DONE	PIN code, no exact address stored
--------------------------	------	-----------------------------------

Distance eligibility check	DONE	Closed a gap where distant creators could apply
Location privacy	DONE	Exact coordinates never leave the server
Brand campaign location	PARTIAL	Radius works; no map picker, no per-campaign pin
Google Maps / Places	MISSING	Not started
Instagram OAuth	DONE	Official API; credentials stay server-side
Automatic follower refresh	PARTIAL	Manual only; no scheduled refresh
Instagram database setup	DEFECT	See Risk 2

Quality Assurance

39 automated backend checks pass against a live database, covering publishing, expiry, plan limits, slot allocation, duplicate and over-capacity applications, distance eligibility, and permissions. 14 frontend tests pass. Type checking is clean.

One check deliberately simulates four people applying to a one-slot campaign at the same moment and confirms exactly one succeeds - the class of bug that otherwise appears only under real traffic.

Caveat: the two defects in Risks 1 and 2 were found by manual review, not by the suite. The suite did not cover the campaign-edit path or a clean-database deployment. Both gaps are worth closing.

Recommended Next Steps

1. Close the campaign-limit bypass and the Instagram migration gap (about half a day combined).
2. Confirm the direction on phone login - it was built and reverted, so the work is recoverable.
3. Provide a test account so the brand screens can be verified visually.
4. Schedule Google Maps and the plan-upgrade screen as the next block of work.
